Task #6

TripUp redesign · design task brief

Friend trips are great. Organizing a friend trip? Less great. Deciding where to go, where to stay, what to eat, and what to do—plus managing expenses and keeping everyone in the loop—can get frustrating, fast.

That's why the brand-new mobile app TripUp was created. It's an all-in-one platform for organizing seamless group travel, whether it's a weekend getaway or a music festival abroad. With TripUp, friends can easily plan their trip down to the last detail, shape their experience as it unfolds, or do a bit of both. Users can collaboratively build itineraries, vote on decisions, track and settle expenses, and more—less frustration, more fun.

With the beta version gaining traction among early adopters, the TripUp team feels it's time to give the app a full redesign. That's where you come in.

User insights

As a new designer joining TripUp, you get up to speed as quickly as possible so you can hit the ground running. You learn that the team is now refining the core experience based on early findings about the user base. Specifically, they want to use key insights on user profiles, behaviors, and preferences, as follows:

User profiles

- *The Organizer:* Typically the most proactive member. They set up the trip, invite others, and keep things moving.
- *The Participants:* They want to be involved without being overwhelmed. They suggest ideas, vote on decisions, and want to stay informed.

User behavior patterns

- *Spontaneous decision-making:* Most group choices (like where to eat) happen on the fly, especially mid-trip. The app must support quick, real-time interactions.
- *Shared ownership:* While one person often leads the group, everyone wants to share their input, particularly on food, activities, and expenses.
- *Low tolerance for friction:* If something takes more than a couple of taps, users switch to WhatsApp. Simplicity is essential.

User preferences

- *Polls over chats:* Users prefer quick tools like polls rather than drawn-out chats—as long as the experience is fast and intuitive.
- *Simple expense tracking:* Users value easy ways to manage and settle group expenses, including in-app payments via bank transfers or other digital methods.
- *Real-time feedback:* When decisions are made, users expect instant updates reflected in the shared itinerary.

Armed with these insights, you’re given a user scenario to base your work on.

User scenario

It’s the last evening of a group trip to Lisbon. After a full day of sightseeing, the group heads back to the house to freshen up and get ready for the night out. Ari, a participant, takes advantage of the downtime to figure out dinner plans: She opens TripUp and lands on the home screen, where all her trips are listed. She then taps into the current trip to open up a group view and adds Ren, a new friend joining for the final dinner.

Ari then creates a poll to help the group choose where to eat. She inputs three nearby restaurants with different vibes, and the app sends a notification to everyone. As votes come in, the app updates the leading option in real time. When the poll closes, the winning spot is automatically added to the itinerary.

Later that evening, after a great meal, Ari logs the dinner expenses. She excludes Ren and Nic from the wine cost, and the app updates each person’s total trip balance accordingly. TripUp consolidates the debts to minimize transfers, and the friends immediately settle their shares directly in the app. A confirmation lets the group know everything’s squared up—ready for the next adventure!

Submission details

You're up! It's time to take TripUp to the next level. We want to see three things from you, in three escalating layers of fidelity:

- **Wireflow: the thinking.** A wireflow that captures the user scenario above, focused on key decisions, state changes, and interaction patterns. **This is where you show us how the app works.** Keep your wireflow lean (typically ten screens or fewer), give it real content rather than *lorem ipsum,* and place it in a dedicated section of your Figma file.
- **High-fidelity screens: the craft.** Two key screens from your wireflow, brought to life at full visual fidelity. **This is where you show us your eye**—your ability to set a design direction and define a coherent visual language independently of any AI output.
- **Interactive prototype: the result.** Using an AI-assisted code generation tool, turn your wireflow into a working, mobile-optimized prototype that walks through the full user journey at demo fidelity. Make sure that your high-fidelity screens appear in your prototype, so we can compare your intent vs. implementation. It’s fine to use mock data instead of real computations. **This is your primary deliverable**—the artifact a PM could actually demo.
    - *Note:* Figma's click-through prototyping mode does not count. The prototype must be real code producing a functional web or mobile app.

What are we looking for?

There are many popular apps already on the market that offer the features described in TripUp—Splitwise for expense splitting, for example. We want to see your ability to recognize when competitors have made good UX choices, when it's worth improving them, and when it makes sense to take a different approach entirely. We're also interested in seeing how you bring

different features together to create a cohesive and seamless experience—both in your static designs and in your working prototype.

When evaluating your work we'll focus on the logic, usability, functionality, and implementation of your design, and ask ourselves the following questions:

- Is the user scenario completely satisfied in your wireflow?
- How usable is the app? Can a user unfamiliar with it quickly understand what to do without guidance?
- Are your screens polished, high-quality, and appealing?
- Is the style consistent across screens?
- Does your prototype faithfully represent your design? Can we see the connection between your hi-fi screens and the corresponding prototype screens?
- Could a product manager interact with your prototype and understand the product without explanation?
- Did you add functionalities that, even if not included in the user scenario and brief above, provide additional value to users?

Design all screens to shine on modern smartphones (iPhone 14 or newer or Android equivalent). Choose one specific device as your reference and keep its original screen dimensions—no scaling.

Submission format

- Share a link to your Figma file containing both the wireflow and the high-fidelity screens. Make sure your file is accessible by setting sharing to **"Anyone with the link can view."**
- Share the public URL of your hosted interactive prototype. This is the URL of your live, hosted interactive prototype—for example, a project link from Lovable, Netlify, Vercel, or any other platform. Ensure it is a publicly accessible URL that we can open in a browser to interact with the application. You may also include a GitHub or GitLab repository alongside the public URL. **Do not submit zip files.**
- Write all text in English

When ready, paste your links into the spaces available below. Do not modify your Figma file or prototype after submission.

Please note that the materials you submit will be used solely for the purpose of evaluating your skills. Any possible resemblance to your work would be purely coincidental and unintentional.

Now go make something amazing!
